Prices and data indicated in this document are for your convenience and were correct at time of printing with the exception of clerical and/or printing errors. Possession of this document by any person or company is not to be construed as an offer to sell to him or to anyone else the goods listed herein at the prices stated.

ALL DATA AND PRICES ARE SUBJECT TO CHANGE WITHOUT NOTICE and shall be subject to those prices in effect at time of shipments. All published and quoted prices are based upon the application of, and all sales are expressly subject to, the Company's Standard Terms and Conditions of Sales are available upon request. This document supersedes all previously published catalog/pricing documents.

WARNING

The information provided for Product Interchange in this catalog is for use only as a general reference by persons qualified to recognize unreasonable selection options. Products suggested as substitutes may have dimensional, rating, pricing and other differences from products to be replaced. This selection method must be used in conjunction with the applicable product catalog which contains important precautions and other pertinent information.

In illustrations throughout this catalog, safety guards have been removed for photographic purposes.

© 2014 Baldor Electric Company

WARNING: Because of the possible danger to person(s) or property from accidents which may result from the improper use of products, it is important that correct procedures be followed: Products must be used in accordance with the engineering information specified in the catalog. Proper installation, maintenance and operation procedures must be observed. The instructions in the instruction manuals must be followed. Inspections should be made as necessary to assure safe operation under prevailing conditions. Proper guards and other suitable safety devices or procedures as may be described or as may be specified in safety codes should be provided, and are neither provided by Baldor Electric Company nor are the responsibility of Baldor Electric. This unit and its associated equipment must be installed, adjusted and maintained by qualified personnel who are familiar with the construction and operation of all equipment in the system and the potential hazards involved. When risk to persons or property may be involved, a holding device must be an integral part of the driven equipment beyond the speed reducer output shaft.

MAXUM XTR Concentric Reducers

MAXUM XTR Concentric Reducers

1. **Housing** - Rugged ductile iron, compact design with increased stiffness to provide dependable performance in less space. Condition monitoring pads are standard for the mounting of accelerometers.
2. **Gearing** - High precision carburized and ground gearing with tooth geometry designed to optimize contact, reduce stress and maximize efficiency.
3. **Bearings** - Longer life tapered and/or spherical roller bearings throughout, designed to meet or exceed AGMA standards and provide a minimum unadjusted L-10 life of 5,000 hours and an average of 25,000 hours. O-ring sealing and steel shims eliminate gasket creep.
4. **Tandem Seals** - Premium HNBR oil seals are protected by an excluder lip auxiliary seal on all shafts. These seals provide high temperature protection, minimize shaft wear, while providing twice the security to contain lubrication and prevent ingress of contaminants.
5. **Lubrication** - Oil level sight plug and magnetic drain plug are standard. Internal housing features enhance oil circulation and accommodate inclined mounting of reducer. Pitot tube for dynamic oil sampling is available as an optional accessory.

Accessories - Available with shaft driven fan, backstop, scoop motor bracket package, or top motor mount.

Specifications

MAXUM XTR Concentric Reducers

MAXUM XTR SPEED REDUCER

The speed reducer shall be a direct coupled, V-belt, or chain driven enclosed concentric type unit with a double or triple reduction ratio. The published rating of the speed reducer shall conform to all applicable AGMA standards.

The reducer housing shall be constructed of corrosion resistant, ductile iron with cast internal walls for added strength. All housings and end covers shall be doweled and precision machined to assure accurate alignment for all gear sets.

All gearing shall be of single helical design, and crown shaved or ground to provide an ellipsoid tooth form to eliminate tooth end bearing and assure meshing in the strongest tooth area. All gears shall be case carburized to insure a high surface durability and resilient tooth core for greater impact resistance and longer service life.

Reducer bearings shall be roller type, and provide a minimum 25,000 hour average life. All seals shall be of the tandem radial lip seal arrangement, made of HNBR material.

Reducer gears and bearings shall be splash lubricated using a quality petroleum base oil containing rust and oxidation inhibitors.

MAXUM XTR SPEED REDUCER WITH SCOOP

The speed reducer shall be direct coupled enclosed concentric type unit with a double or triple reduction ratio.

The published rating of the speed reducer shall conform to all applicable AGMA standards. The motor shall be supported by a steel fabricated scoop of rigid design to maintain motor shaft alignment to the input shaft of the speed reducer.

The reducer housing shall be constructed of corrosion resistant, ductile iron with cast internal walls for added strength. All housings and end covers shall be doweled and precision machined to assure accurate alignment for all gear sets.

All gearing shall be of single helical design, and crown shaved or ground to provide an ellipsoid tooth form to eliminate tooth end bearing and assure meshing in the strongest tooth area. All gears shall be case carburized to insure a high surface durability and resilient tooth core for greater impact resistance and longer service life.

Reducer bearings shall be roller type, and provide a minimum 25,000 hour average life.

All seals shall be of the tandem radial lip seal arrangement, made of HNBR material.

Reducer gears and bearings shall be splash lubricated using a quality petroleum base oil containing rust and oxidation inhibitors.

The fabricated steel scoop shall be supported by the reducer housing and shall include a means of accommodating the motor frame required.

A flexible coupling of either the elastomeric or grid type design shall be furnished to couple motor to reducer. The couplings shall be furnished with Taper-Lock bushings, or bored-to-size, for attachment of coupling flange to shafts. The shaft coupling shall be covered by an approved guard as required.

MAXUM XTR SPEED REDUCER WITH BASE PLATES

The speed reducer shall be direct coupled enclosed concentric type unit with a double or triple reduction ratio. The published rating of the speed reducer shall conform to all applicable AGMA standards. The motor shall be supported by a steel fabricated baseplate of rigid design to maintain motor shaft alignment to the input shaft of the speed reducer.

The reducer housing shall be constructed of corrosion resistant, ductile iron with cast internal walls for added strength.

All housing and end covers shall be doweled and precision machined to assure accurate alignment for all gear sets.

All gearing shall be of single helical design, and crown shaved or ground to provide an ellipsoid tooth form to eliminate tooth end bearing and assure meshing in the strongest tooth area. All gears shall be case carburized to insure a high surface durability and resilient tooth core for greater impact resistance and longer service life.

Reducer bearings shall be roller type, and provide a minimum 25,000 hour average life. All seals shall be of the tandem radial lip seal arrangement, made of HNBR material.

Reducer gears and bearings shall be splash lubricated using a quality petroleum base oil containing rust and oxidation inhibitors.

The steel baseplate shall be of Heavy Duty design, precision machined and stress relieved, and shall include a means of accommodating the motor frame required and providing the proper alignment with reducer shaft.

A flexible coupling of either the elastomeric or grid type design shall be furnished to couple the motor to the reducer. The couplings shall be furnished with Taper-Lock bushings, or bored-to-size, for attachment of coupling hub to the shafts. The shaft coupling shall be covered by an approved guard as required.

MAXUM XTR Concentric Reducers

HOW TO ORDER MAXUM XTR REDUCERS

Once the correct DODGE MAXUM XTR Concentric Shaft Reducer and accessories have been selected from information published in this catalog, the complete assembly can be specified or ordered using the nomenclature provided and/or the part numbers listed in the Selection/Dimensions section on pages 24-41.

NOTE: If selection cannot be made from information herein, technical assistance is available to recommend drives for new or existing applications. Submit full details to DODGE MAXUM XTR Application Engineering (864) 288-9050; DODGE Customer Service (864) 297-4800.

SERVICE FACTORS

The service factors that follow are adapted from AGMA.

Applications which expose the gear drive to high starting torques, extreme repetitive shock, or where high energy loads must be absorbed as when stalling, require special consideration. Service factors for these special applications should be agreed upon by the user and Baldor since variations of the values in the table may be required.

The service factors in the service factor table are based on the use of an electric or hydraulic motor or the use of a steam or gas turbine as a prime mover. If the prime mover is a single or multi-cylinder engine, then the service factor must be adjusted in accordance with the table.

**Conversion Table For Single or multi-cylinder engines

▲ See Mill, Rotary

(1) Service factors for paper mill applications are applied to the nameplate rating of the electric motor at the motor rated base speed

(2) Using anti-friction bearings only. Use 1.50 for sleeve bearings

(3) When a super calender operates over a speed range of part constant horsepower and part constant torque and the constant horsepower speed range is greater than 1.5:1, use a service factor of 1.00 at base speed. When operating at constant torque over the entire speed range or when the constant horsepower speed range is less than 1.5:1, a 1.25 service factor should be used.

▲ Minimum cooling requirements are based on an ambient temperature of 80°F (27°C) at sea level (0-2500 ft.) If your operating conditions are different, the application adjusted thermal rating must be calculated and compared to the Thermal Rating Tables to ensure adequate cooling is provided.

† The overhung load and minimum sprocket pitch diameter are appropriate for loads applied one shaft diameter from the seal cage with a service factor of unity. When overhung load is proportional to torque (i.e., pinion, sprocket) adjustment to the published values must be made based on the minimum required service factor.

▲ Minimum cooling requirements are based on an ambient temperature of 80°F (27°C) at sea level (0-2500 ft.) If your operating conditions are different, the application adjusted thermal rating must be calculated and compared to the Thermal Rating Tables to ensure adequate cooling is provided.

† The overhung load and minimum sprocket pitch diameter are appropriate for loads applied one shaft diameter from the seal cage with a service factor of unity. When overhung load is proportional to torque (i.e., pinion, sprocket) adjustment to the published values must be made based on the minimum required service factor.

▲ Minimum cooling requirements are based on an ambient temperature of 80°F (27°C) at sea level (0-2500 ft.). If your operating conditions are different, the application adjusted thermal rating must be calculated and compared to the Thermal Rating Tables to ensure adequate cooling is provided.

† The overhung load and minimum sprocket pitch diameter are appropriate for loads applied one shaft diameter from the seal cage with a service factor of unity. When overhung load is proportional to torque (i.e., pinion, sprocket) adjustment to the published values must be made based on the minimum required service factor.

- ◆ Consult factory for combinations of accessories not listed.
 - Different fan part numbers are used for reducers with scoop mounts.
 - * Consult factory
- YES = Indicates combination of standard accessories is compatible.

NOTE: Verify application compatibility and fit of accessories and components.

MAXUM XTR Concentric Reducers

SHAFT COOLING FANS

When the thermal capacity of the MAXUM XTR Concentric Shaft Reducer is exceeded, cooling fans provide an optional, inexpensive way of lowering the oil temperature thus increasing the thermal capacity. Selection tables indicate the need for cooling fans. Refer to the thermal tables on pages 72-79. Fan speed not to exceed 2300 RPM. Consult factory for fan speeds in excess of 2300 RPM.

MAXUM XTR Concentric Reducers

ELECTRIC FANS / DIMENSIONS - (inches)

Electric fans are not affected by shaft rotation or direction and can be mounted on either side of the MAXUM XTR and allow the use of the full MAXUM XTR shaft length.

Electric fans are available with the motor specifications listed in chart below.

Consult factory for other motor options that may be available.

♦ Refer to Accessory Compatibility Table on page 42.

HEAT EXCHANGER COOLING PACKAGES

For thermal capacities beyond the range of cooling fans, an optional heat exchanger cooling package is available to achieve the use of full mechanical HP rating by lowering the oil temperature.

The cooling package is available to cover the basic reducer sizes CR50 through CR130. (See thermal HP

table on pages 72-79.)

Specifications for the heat exchanger motor are as follows: 1/2 HP, 60 Hz, 3 Ph, 230/460 Volt, TEFC, 56 Frame. Minimum coolant (water) flow is 3 G.P.M. based upon a maximum water temperature of 80°F. Minimum oil temperature for operation is 60°F.

Part number **273933**.

MAXUM XTR Concentric Reducers

An optional dipstick is available for applications where viewing of the side oil sight plug is not possible. The dipstick is suitable for foot mounted reducers where the foot is in the horizontal plane below the rotating shafts. Consult the factory for applications where the reducer is mounted on an incline.

The dipstick is vented and should be installed in the existing vent hole location. The dipstick comes pre-marked and is dependent on reducer size, output speed, and presence of fan (shaft driven or electric) accessory. The dipstick part number can be identified from the table below.

▲ Refer to accessory compatibility table on page 42.

* Consult factory for reducers mounted on an incline and/or sealed dipsticks.

MAXUM XTR Concentric Reducers

SCOOP MOUNT MOTOR/REDUCERS

DODGE MAXUM XTR Scoop Motor Mounts are available for all reducer sizes ranging in motor frame sizes from 140T to 440T. Scoop mounting your motor can be an economical alternative to foot mounting or where fastening the motor to a rigid foundation is not possible. The Scoop Motor Mount Kit can be supplied with your reducer and factory-mounted Baldor AC NEMA motors, or may be ordered separately for use with customer supplied AC motors.

INCLUDED COUPLINGS

DODGE PARA-FLEX® couplings are standard with all Scoop Motor Mount Kits, however, DODGE GRID-LIGN couplings are also available.

THERMAL LIMITATIONS

Thermally limited reducers should be equipped with a cooling fan or heat exchanger as required. Refer to pages 72-79 for thermal data. Refer to pages 43-44 for cooling fan information.

COMPATIBLE ACCESSORIES

Refer to the Accessory Compatibility Table on page 42 for other accessories that can be used in conjunction with scoop motor mounts.

COMPATIBILITY WITH BRAKE MOTORS

Scoop Motor Mount kits were not designed to be compatible with brake motors. If the application is using a brake motor, forward brake motor dimensions and application data to Baldor for engineering review prior to placing order.

DRIVE SYSTEM VIBRATION

Scoop Motor Mounts are NOT recommended for variable speed DC or AC applications. Scoop Motor Mounts were designed for use with constant speed motors at 1750 RPM. Use of motors with lower base speeds increases the chance of producing resonance. The probability of a constant speed motor operating at resonant frequency is remote, however, should this occur, the customer must add stiffening supports to the scoop bottom plate to move the resonant frequency away from the motor operating speed. For recommended scoop mount support, contact Baldor.

CAUTION: The customer is responsible and Baldor expressly disclaims responsibility for isolating the Scoop Motor Mount from any vibratory or transient load induced by the motor or other equipment driven by the motor. The Scoop Motor Mount is expressly not warranted against failure or unsatisfactory operation resulting from dynamic vibration of any form imposed upon it whether by the drive system in which it is installed or for any other reason, no matter how induced.

NOTE: The high speed coupling may be required to overhang the input shaft when a cooling fan or backstop is used in combination with the scoop mount.

MAXUM XTR Concentric Reducers

The MAXUM XTR Motor Mount is a rugged fabricated steel assembly which requires no drilling or foundation. It bolts directly to the reducer and accommodates a wide variety of NEMA AC motor frames.

For initial belt installation, the adjustment screws can be set at the minimum position which offers adequate future V-belt adjustment.

HD BASEPLATE ASSEMBLIES

Heavy Duty Baseplates are rigid units fabricated of heavy steel, providing a sturdy mounting base for motor/ coupling/ reducer combinations. This accessory is recommended for large motors where the motor weight exceeds the reducer weight or 700 lbs. and for variable speed DC or AC application regardless of the motor weight. The combination of a factory mounted Baldor only motor, DODGE coupling, MAXUM XTR reducer and HD

baseplate becomes a drive package warranted as a single system.

HD baseplate assemblies include baseplate, Para-Flex coupling and coupling guard.

When mounting variable speed AC or DC motors, consult general guidelines on pages 88-89.

Consult factory for baseplate dimensions.

MAXUM XTR Concentric Reducers

BACKSTOP ASSEMBLIES

Optional backstops are offered for service conditions that require the prevention of reverse rotation. On reducer sizes 50 through 90, the backstops are internally mounted. On reducer sizes 100 through 130, the backstops are externally mounted on an extended high speed shaft.

NOTE: All backstops have a maximum overrunning speed limitation of 1800 RPM.

When ordering a reducer with a backstop, it will be necessary to indicate on the order the desired direction of rotation of the output shaft, either by designating "CW" for clockwise or "CCW" for counter clockwise, when looking at the output shaft.

WARNING: Backstops are not to be used for applications involving energy absorption and shock or torque loads in excess of reducer ratings nor on applications such as chair lifts, amusement rides, etc., and where the safety of property is dependent on their function. On such applications, other holding devices must be provided. DO NOT use a backstop as a substitute for a brake. DO NOT use a backstop for indexing. Backstopping more frequently than five times in an eight hour period, or less than one minute between applications, is categorized as indexing.

Refer to page 42 for compatibility of various combinations of reducers and accessories

MAXUM XTR Concentric Reducers

SLIDE BASES

The MAXUM XTR Reducer Slide Base positions the reducer, providing simplified installation and servicing of belt and chain drives. When a change in reducer position is desired, simply loosen reducer hold-down bolts and slide reducer by using the adjusting screw provided. After desired belt or chain tension has been obtained, retighten reducer bolts and unit is ready to operate.

MAXUM XTR Concentric Reducers

TORQUE METHOD OF SELECTION

Step 1: Determine Service Factor - See pages 7-9 for electric motor, hydraulic motor, steam turbine or gas turbine driven applications operating up to 10 hours per day or over 10 hours per day. If the application is engine driven, refer to table on page 6 to convert the service factor obtained from Service Factors table on pages 7-9 to the service factor required for engine driven applications. Service factor recommendations are minimum. (For extreme shock or high energy loads which must be absorbed, as when stalling, or for power sources not listed, consult DODGE for special consideration.)

NOTE: AGMA classifies scoop mounted motors as gearmotor applications which are sized using a load classification in place of a service factor. (See Easy Selection Chart, pages 10-23.)

Step 2: Calculate Equivalent Horsepower - Multiply the actual horsepower to be transmitted by the service factor obtained from Step 1.

Step 3: Calculate Required Ratio - Divide the high speed shaft rpm by the low speed shaft rpm.

CAUTION: Instantaneous gear loading is limited to 200% of the reducer rating. Do not allow starting load or other peak loads to exceed this value. Failure to observe this precaution could result in damage to, or destruction of, the equipment.

Step 4: Determine Unit Size and Ratio - Refer to the horsepower tables on pages 66-71. From the high speed shaft rpm in the left hand column and desired ratio and low speed shaft RPM in the next two columns, trace right into the table and find the horsepower rating equal to or greater than the equivalent horsepower obtained from Step 2. (When the required input speed falls between those tabulated, use straight line interpolation to determine the unit rating.)

Step 5: Check Thermal Ratings - Adjust the actual horsepower required (without service factor) for ambient operating conditions as described on page 73 to determine actual thermal HP. Compare the actual thermal HP to the thermal ratings on pages 74-79. If actual thermal HP exceeds the thermal capacity, an auxiliary cooling fan or a heat exchanger may be added to provide additional thermal capacity or a larger reducer may be selected.

Step 6: Check Overhung and Thrust Loads - Overhung loads may be imposed on the input or output shafts when connected by means other than a coupling. If overhung loads are present, refer to page 80 for method to calculate overhung load. If calculated OHL exceeds published capacity on page 82, consult Baldor.

External thrust loads may exist in applications such as agitators, mixers and similar equipment. Calculate the direction and magnitude of the thrust and provide complete application information to Baldor for review.

Step 7: Variable Speed Applications - Provide complete application information to Baldor for engineering review.

Step 8: Check Dimensions - Refer to pages 24-41 for dimensions, weights and part numbers.

TORQUE METHOD OF SELECTION

Steps 1 through 3: Determine service factor, equivalent torque and required ratio using similar steps from the horsepower method.

Step 4: Determine Unit Size and Ratio - Refer to torque tables on pages 66-71. From the high speed shaft rpm in the left hand column and desired ratio and output rpm in the next two columns, trace right into the table and find the torque rating equal to or greater than the required torque calculated above.

Step 5: Check Thermal Ratings - Convert required torque (without service factor) to horsepower using the formula below. Check thermal ratings based on the procedure described in the horsepower method.

$$\text{Horsepower} = \frac{\text{Torque (lb-in)} \times \text{Output Shaft rpm}}{63025}$$

Steps 6 through 8: Refer to horsepower method.

EXAMPLES OF SELECTION

Horsepower Method

A centrifugal pump operating at 230 rpm is driven by a 150 horsepower 1750 rpm motor. The duty cycle is 24 hours per day. Both the input and output reducer shafts are coupling connected.

Step 1: Determine Service Factor - Since the centrifugal pump is operating more than 10+ hours/day, a service factor of 1.25 is recommended (see page 7).

Step 2: Calculate Equivalent Horsepower - Multiply the motor horsepower by the service factor ($150 \times 1.25 = 187.5$) to get the equivalent horsepower of 187.5.

Step 3: Calculate Required Ratio - Divide the high speed shaft rpm by the low speed shaft rpm ($1750 / 230 = 7.6$) to get the required ratio of 7.6:1.

Step 4: Determine Unit Size and Ratio - Locate the horsepower table for 1750 high speed shaft rpm on page 66. Trace down the ratio column to the closest nominal ratio to the 7.6:1 required ratio and find 7.59:1 ratio. Trace to the right until the horsepower equals or exceeds the calculated equivalent horsepower of 187.5 and find 229 horsepower listed under a size 70 reducer.

Step 5: Check Thermal Ratings - Calculate actual thermal HP per the procedure on page 72. Refer to thermal rating tables on pages 74-79 and find the thermal rating for the size 70 reducer at 1750 input rpm. Note that the thermal rating without fan is 83 horsepower and the thermal rating with fan is 135 horsepower. Compare the actual thermal HP to these values to determine if additional cooling is required.

Step 6: Check Overhung Load and Thrust Loads - Since both input and output shafts are coupling connected, overhung or thrust loads are not applied.

Step 7: Variable Speed Applications - Does not apply.

Step 8: Check Dimensions - Refer to pages 24-41 for dimensions, weights and part numbers.

MAXUM XTR Concentric Reducers

TORQUE METHOD

Running 10 hours a day, a scum breaker for a sewage disposal system requires 34,233 lb-in of torque at 230 rpm and has an overhung load of 4,712 pounds on the low speed shaft. The overhung load is located 4 inches out from the reducer on the usable shaft extension. The motor speed is 1170 rpm and is coupling connected.

Step 1: Determine Service Factor - Since the scum breaker is operating 10 hours/day, a service factor of 1.50 is recommended (see page 9).

Step 2: Calculate Equivalent Torque - Multiply the system torque of 34,233 by the service factor of 1.50 ($34,233 \times 1.50 = 51,349$) to get 51,349 lb-in equivalent torque.

Step 3: Calculate Required Ratio - Divide the high speed shaft rpm by the low speed shaft rpm ($1170 / 230 = 5.09$) to get the required ratio of 5.09:1.

Step 4: Determine Unit Size and Ratio - Locate the torque table for 1170 high speed shaft rpm on page 69. Trace down the ratio column to the closest nominal ratio to the 5.09:1 required ratio and find 5.06:1 ratio. Trace to the right until the torque equals or exceeds the calculated equivalent torque of 51,349 and find 57,400 listed under a MAXUM XTR size 70 reducer.

Step 5: Check Thermal Ratings - Convert the required torque without service factor (34,233) to horsepower at 230 rpm as follows:

$$\text{Horsepower} = \frac{34,233 \times 230}{63025} = 125 \text{ hp}$$

Calculate the actual thermal horsepower requirement per the procedure on page 72. For this example, the ambient adjustment factors are all considered to be 1.0. Refer to thermal rating tables on page 76 and find the thermal rating for the size 70 reducer at 1170 input rpm. Since the 125 calculated horsepower exceeds the thermal rating shown without fan (91), an auxiliary cooling fan is required. The size 70 has a thermal horsepower rating of 137 with fan so this meets the thermal horsepower requirement.

Step 6: Check Overhung Load and Thrust Loads - An overhung load of 4,712 pounds is on the low speed shaft. It must be adjusted for its position on the shaft. Refer to page 80 for the load location factor table and locate the 4 inch distance in the left hand column. Under the MAXUM XTR 70 column find the load location factor of 1.12. Multiply the 4,712 overhung load by this factor ($4,712 \times 1.12 = 5,183$) to get an equivalent overhung load of 5,183 pounds. Now turn to the overhung load capacity table on page 85 and locate 230 output rpm in the left hand column. Trace right to the MAXUM XTR size 70 reducer and find the overhung load capacity of 5,490 pounds. Since the capacity exceeds the equivalent overhung load, the selection is acceptable.

Step 7: Variable Speed Applications - Does not apply.

Step 8: Check Dimensions - Refer to pages 24-41 for dimensions, weights and part numbers.

MAXUM XTR Concentric Reducers

Thermal rating is the actual horsepower (without service factor) that a drive can continuously transmit without overheating. The thermal HP shown on pages 74-79 are based on an ambient temperature of 80°F, altitude less than 2,500 feet, an external air flow between 100 and 275 ft per minute, with no direct exposure to sunlight. The thermal HP is based on providing a maximum calculated sump temperature of 200°F.

If operating conditions do not match the values above, the thermal HP must be adjusted to determine the actual thermal HP based upon operating conditions. Actual thermal HP equals the published thermal HP multiplied by the appropriate factors shown below.

$$\text{Actual Thermal HP} = \text{Published Thermal HP} \times B_{\text{REF}} \times B_A \times B_D \times B_V$$

If the Actual Thermal Horsepower is less than the mechanical horsepower, then a cooling fan or other method needs to be added to increase the Actual Thermal Horsepower. Failure to consider actual operating conditions may result in shortened reducer life or catastrophic failure.

Ambient Temperature Adjustment Factor

Ambient Temperature (°F)	B _{REF}
50	1.19
60	1.13
70	1.07
80	1.00
90	0.93
100	0.86
110	0.78
120	0.69

Altitude Adjustment Factor

Altitude (ft)	B _A
0 – Sea Level	1.00
2500	0.95
5000	0.90
7500	0.85
10000	0.81
12500	0.76
15000	0.72
17500	0.68

Ambient Air Velocity Adjustment Factor

Air Velocity (fpm)	B _V
≤ 100	0.75
> 100 and ≤ 275	1.00
> 275 and < 725	1.40
≥ 725	1.90

Duty Cycle Adjustment Factor

Operation Time per Hour	B _D
100% (continuous)	1.00
80% (48 minutes per hour)	1.05
60% (36 minutes per hour)	1.15
40% (24 minutes per hour)	1.35
20% (12 minutes per hour)	1.80

* Actual horsepower, without service factor, that reducer will transmit continuously without overheating.

† Refer to tables on page 73 for application adjustment factors.

MAXUM XTR Concentric Reducers

OVERHUNG LOAD CALCULATION - Overhung load can be calculated based on the formula below. For applications where load is proportional to torque (i.e., sheave, sprocket, pinion) an equivalent power (motor power * s.f.) should be used in the calculation.

$$OHL(\text{lbs}) = \frac{126,000 \times hp \times Fc \times Lf}{PD(\text{inches}) \times rpm}$$

$$OHL (\text{N}) = \frac{19,100,000 \times kW \times Fc \times Lf}{PD(\text{mm}) \times rpm}$$

Where:

- OHL = Overhung Load
- hp = Horsepower
- kW = kilowatts
- Fc = Load Connection Factor
- Lf = Load Location Factor
- PD = Pitch Diameter of Item Mounted on Shaft
- rpm = Revolutions Per Minute

Load Connection Factors - Fc

Drive Type	Fc

* Overhung load ratings are for pure radial loads applied one shaft diameter away from the seal carrier and a service factor of 1.0. If overhung load is proportional to torque (i.e., sheave, sprocket, pinion) an appropriate service factor should be applied (refer to OHL calculation on pages 80-81). Consult Baldor if application has combined radial and thrust loads.

* Overhung load ratings are for pure radial loads applied one shaft diameter away from the seal carrier and a service factor of 1.0. If overhung load is proportional to torque (i.e., sheave, sprocket, pinion) an appropriate service factor should be applied (refer to OHL calculation on pages 80-81). Consult Baldor if application has combined radial and thrust loads.

MAXUM XTR Concentric Reducers

OVERHUNG LOAD CALCULATION - Overhung load can be calculated based on the formula below. For applications where load is proportional to torque (i.e., sheave, sprocket, pinion) an equivalent power (motor power * s.f.) should be used in the calculation.

$$OHL(\text{lbs}) = \frac{126,000 \times \text{hp} \times Fc \times Lf}{PD(\text{inches}) \times \text{rpm}}$$

$$OHL(\text{N}) = \frac{19,100,000 \times \text{kW} \times Fc \times Lf}{PD(\text{mm}) \times \text{rpm}}$$

Where:

OHL = Overhung Load
 hp = Horsepower
 kW = kilowatts
 Fc = Load Connection Factor
 Lf = Load Location Factor
 PD = Pitch Diameter of Driven Item
 rpm = Revolutions Per Minute

Load Connection Factors - Fc

Drive Type	Fc
Roller Chain Sprocket	1
Machined Pinion or Gear	1.25
Synchronous Belt	1.3
V-Belt	1.5
V-Ribbed Belt	1.7
Flat Belt	2.5

MAXUM XTR Concentric Reducers

DODGE MAXUM XTR Concentric Shaft Reducers can be modified to permit mounting in positions other than the conventional (A-1) floor mounting. Some of these include ceiling (A-3) and wall (A-2 and A-4) and various inclined, vertical and tilted positions. Consult factory to determine what modifications are required for your specific application.

In order for DODGE to make recommendations on the required modifications, the following information must be provided:

- Reducer Size.
- Ratio.
- Input and/or output speed.
- Transmitted Horsepower.
- Duty cycle. Continuous or intermittent operation. If intermittent, running time vs. idle time.
- Mounting position, such as A-2, A-3 or A-4 with shafts level, or a more complete description of the mounting arrangement including the angle of tilt of the housing, the incline of the shafts and whether the output shaft is higher or lower than the input shaft.

MAXUM XTR Concentric Reducers

General Guidelines for Mounting Variable Speed AC or DC Motors

AMPLITUDE RATIO

DEFINITIONS:

FUNDAMENTAL NATURAL FREQUENCY is the lowest number of times per minute that the motor and supporting structure will maintain a periodic oscillation, once displaced, under the sole influence of its own mass and stiffness.

RESONANCE is a vibration of large amplitude caused

by the small periodic stimulus of the unbalance force when the motor speed is the same or nearly the same frequency as the fundamental natural frequency of the motor and support structure.

SOFT MOUNTING - The fundamental natural frequency is below the motor operating speed.

HARD MOUNTING - The fundamental natural frequency is above the motor operating speed.

MAXUM XTR Concentric Reducers

General Guidelines for Mounting Variable Speed AC or DC Motors

SCOOP MOUNT ACCESSORY

- This is a soft mounting of the motor.
- The benefits obtained by using this accessory are low cost and isolation of the reducer support structure from the motor vibration.
- This motor mount was designed for use with a constant speed motor at 1750 RPM. Use of motors with lower base speeds increases the chance of producing resonance. Stiffening techniques within the scoop structure can increase the fundamental natural frequency about 20% which is generally enough to eliminate resonance should it occur.
- This accessory is NOT recommended for variable speed DC or AC applications.
- Customers who prefer to use the scoop mount accessory to mount variable speed AC or DC motors must state on the face of the purchase order that they plan to support scoop and assume full responsibility for any vibratory or transient load induced by the motor.

NOTE: For more information on DODGE MAXUM XTR Concentric Reducer Scoop Mount Reducers, refer to page 46.

TOP MOUNT ACCESSORY

- This may be a soft or hard mounting of the motor depending on the size of the motor and the distance that the adjusting screws are extended.
- The benefits obtained by using this accessory are low cost, minimum floor space used for the motor/reducer assembly, and greater flexibility to obtain the required output RPM of the reducer than concentric coupling.

- This motor mount was designed for use with a constant speed motor at 1750 RPM.
- This accessory is NOT recommended for variable speed DC or AC applications.

NOTE: For more information on DODGE MAXUM XTR Concentric Reducer Motor Mount, refer to page 59.

HD BASEPLATE ACCESSORY

1. This is a hard mounting of the motor.
 2. The benefits obtained by using this accessory are:
 - a. Resonance problems are minimized
 - b. Accurate assembly of motor/coupling/reducer can be done at the factory instead of the job site.

Note: Alignment must always be rechecked at job site prior to start-up.

 - c. Large motors can be rigidly mounted to keep deflection under control and provide longer service life.
3. This accessory is recommended for large motors where the motor weight exceeds the reducer weight or 700 lbs., and for variable speed DC or AC applications regardless of the motor weight.

NOTE: For more information on DODGE MAXUM XTR Concentric Reducer HD Baseplates, refer to page 60.

MAXUM XTR Concentric Reducers

4-Holes for H Diameter Bolts

Dimensional Comparison of MAXUM to MAXUM XTR

Reducer Size	Stage	C (in.)	D (in.)	E (in.)	F (in.)	G (in.)	H (in.)	U (in.)	UA (in.)
CR4	Double	25.47	9.60	7.30	9.00	9.45	0.875	2.875 / 2.874	1.625 / 1.624
	Triple	25.47							1.625 / 1.624
CR50	Double	21.54	9.60	7.30	7.10	8.10	0.875	2.5000 / 2.4995	1.6250 / 1.6245
	Triple	21.54							1.2500 / 1.2495

	Triple	45.88							2.2500 / 2.2495

MAXUM XTR Concentric Reducers

Retrofitting Guide to Replace MAXUM with MAXUM XTR - Sizes CR4 through CR6

STEP 1 - Identify MAXUM XTR replacement for the current MAXUM reducer. The replacement size is generally suitable to replace the current MAXUM, however thermal and mechanical ratings should be compared to application requirements to ensure suitability for use. Consult Baldor if the replacement size does not meet application requirements.

STEP 2 - Determine if special output shaft is required. Special output shafts have been designed to match current MAXUM distance from foundation hole to the end of output shaft. Alternatively, the standard MAXUM XTR reducer may be able to replace the current MAXUM using a spacer coupling or an overhung hub on the output shaft extension. Preference should be given to the standard reducer for better cost and availability.

STEP 3 - Identify cooling requirements. Existing cooling devices may not be suitable for the MAXUM XTR.

STEP 4 - Identify motor foundation. MAXUM scoops and motor mounts are suitable for retrofitting to the MAXUM XTR with an additional parts kit. The parts kit listed provides only those parts needed to retrofit. If a completely new scoop or motor mount is desired, order the accessory complete as listed under selection & dimensions tables.

STEP 1 Identify Replacement Size		STEP 2 Determine if Special Output Shaft is Required		STEP 3 Identify Cooling Requirements		STEP 4 Identify Motor Foundation		
Current MAXUM Reducer	MAXUM XTR Replacement	Special Output Shaft Desired	Action	Type of Cooling	Action	Baseplate or Foundation Mounted Motor	Scoop	Motor Mount
CR4	CR50 ¹	No	Refer to Selection & Dimension Page for Basic Reducer Part Number	Shaft Driven Fan	Refer to Selection & Dimension Page for New Fan Part Number	Add foundation holes for new motor location -or-	Order New Side Brackets & Hardware	Order New Brackets & Hardware to Retrofit Existing Motor Mount to New Reducer
		Yes	Order Basic Reducer with Special Output Shaft Part Number 270498	Other	Consult Baldor		Motor Frames 140-250 Part Number 269921	
				None	Go To Step 4	Use spacer coupling at input shaft	Motor Frames 280-320 Part Number 269922	Part Number 270005
		No	Refer to Selection & Dimension Page for Basic Reducer Part Number	Shaft Driven Fan	Refer to Selection & Dimension Page for New Fan Part Number		Order New Side Brackets & Hardware	Order New Brackets & Hardware to Retrofit Existing Motor Mount to New Reducer
CR5	CR60 ²	Yes	Order Basic Reducer with Special Output Shaft Part Number 270499	Other	Consult Baldor	Add foundation holes for new motor location -or-	Motor Frames 140-320 Part Number 269923	
				None	Go To Step 4		Motor Frame 360 Use Standard Welded Scoop	Part Number 270105
		No	Refer to Selection & Dimension Page for Basic Reducer Part Number	Shaft Driven Fan	Refer to Selection & Dimension Page for New Fan Part Number	Add foundation holes for new motor location -or-	Order New Side Brackets & Hardware	Order New Brackets & Hardware to Retrofit Existing Motor Mount to New Reducer
		Yes	Order Basic Reducer with Special Output Shaft Part Number 270500	Other	Consult Baldor		Motor Frames 140-320 Part Number 269924	
				None	Go To Step 4		Motor Frame 360 Use Standard Welded Scoop	Part Number 270398

- NOTES:**
1. The F dimension (see dimensional comparison) of the CR50 is slightly different than the CR4. New foundation holes at the input end will be required.
 2. The D dimension (see dimensional comparison) of the CR60 is slightly greater than the CR5. The height of the reducer foundation or the driven equipment must be adjusted to suit.
 3. Verify application compatibility and fit of accessories and components.

MAXUM XTR Concentric Reducers

Retrofitting Guide to Replace MAXUM with MAXUM XTR - Sizes CR7 through CR9

STEP 1 - Identify MAXUM XTR replacement for the current MAXUM reducer. The replacement size is generally suitable to replace the current MAXUM, however thermal and mechanical ratings should be compared to application requirements to ensure suitability for use. Consult Baldor if the replacement size does not meet application requirements.

STEP 2 - Determine if adapter plate is available. The adapter plate will be bolted to the existing foundation and feature tapped holes for the new Maxum XTR. The difference in foundation hole locations will nominally align the end of the output shaft extension with the existing Maxum drive. Alternatively, the standard MAXUM XTR reducer may be used without adapter plate by adding new holes in the customer's foundation and shimming the reducer to the appropriate height.

STEP 3 - Identify cooling requirements. Existing cooling devices may not be suitable for the MAXUM XTR.

STEP 4 - Identify motor foundation. MAXUM scoops and motor mounts are suitable for retrofitting to the MAXUM XTR with an additional parts kit. The parts kit listed provides only those parts needed to retrofit. If a completely new scoop or motor mount is desired, order the accessory complete as listed under selection & dimensions tables.

STEP 1 Identify Replacement Size		STEP 2 Determine if Foundation Adapter Plate is Available		STEP 3 Identify Cooling Requirements		STEP 4 Identify Motor Foundation		
Current MAXUM Reducer	MAXUM XTR Replacement	Is Adapter Plate Desired?	Action	Type of Cooling	Action	Baseplate or Foundation Mounted Motor	Scoop	Motor Mount
CR7	CR80 ¹	No	Refer to Selection & Dimension Page for CR80 & modify foundation to suit.	Shaft Driven Fan	Refer to Selection & Dimension Page for New Fan Part Number	Add foundation holes for new motor location -or- Use spacer coupling at input shaft	Order New Side Brackets & Hardware Motor Frames 210-320 Part Number 271589	Order New Brackets & Hardware to Retrofit Existing Motor Mount to New Reducer Part Number 271744
		Yes	Order Basic Reducer with Special Adapter Plate Part Number 271743	Other	Consult Baldor		Motor Frame 360-440 Use Standard Welded Scoop	
				None	Go To Step 4			
CR8	CR90 ²	No	Refer to Selection & Dimension Page for CR90 & modify foundation to suit.	Shaft Driven Fan	Refer to Selection & Dimension Page for New Fan Part Number	Add foundation holes for new motor location -or- Use spacer coupling at input shaft	Order New Side Brackets & Hardware Motor Frames 210-320 Part Number 271590	Order New Brackets & Hardware to Retrofit Existing Motor Mount to New Reducer Part Number 271745
		Yes	Differences in the "D" dimension are insufficient to accommodate an adapter plate.	Other	Consult Baldor		Motor Frame 360-440 Use Standard Welded Scoop	
				None	Go To Step 4			
CR9	CR100 ²	No	Refer to Selection & Dimension Page for CR100 & modify foundation to suit.	Shaft Driven Fan	Refer to Selection & Dimension Page for New Fan Part Number	Add foundation holes for new motor location -or- Use spacer coupling at input shaft	Order New Side Brackets & Hardware Motor Frames 250-320 Part Numbers 271591 & 273428	Order New Brackets & Hardware to Retrofit Existing Motor Mount to New Reducer Part Number 271746
		Yes	Differences in the "D" dimension are insufficient to accommodate an adapter plate.	Other	Consult Baldor		Motor Frame 360-440 Use Standard Welded Scoop	
				None	Go To Step 4			

NOTES: 1. Foundation hole locations are different. An adapter plate is available to retrofit the CR80 to the CR7 foundations holes.

2. Foundation hole locations are different. Modifications to existing foundation is required.

3. Verify application compatibility and fit of accessories and components.

MAXUM XTR Concentric Reducers

Retrofitting Guide to Replace MAXUM with MAXUM XTR - Sizes CR10 through CR12

STEP 1 - Identify MAXUM XTR replacement for the current MAXUM reducer. The replacement size is generally suitable to replace the current MAXUM, however thermal and mechanical ratings should be compared to application requirements to ensure suitability for use. Consult Baldor if the replacement size does not meet application requirements.

STEP 2 - Determine if adapter plate is available. The adapter plate will be bolted to the existing foundation and feature tapped holes for the new Maxum XTR. The difference in foundation hole locations will nominally align the end of the output shaft extension with the existing Maxum drive. Alternatively, the standard MAXUM XTR reducer may be used without adapter plate by adding new holes in the customer's foundation and shimming the reducer to the appropriate height.

STEP 3 - Identify cooling requirements. Existing cooling devices may not be suitable for the MAXUM XTR.

STEP 4 - Identify motor foundation. MAXUM scoops and motor mounts are suitable for retrofitting to the MAXUM XTR with an additional parts kit. The parts kit listed provides only those parts needed to retrofit. If a completely new scoop or motor mount is desired, order the accessory complete as listed under selection & dimensions tables.

STEP 1 Identify Replacement Size		STEP 2 Determine if Foundation Adapter Plate is Available		STEP 3 Identify Cooling Requirements		STEP 4 Identify Motor Foundation
